

Learning about composting

Project by Hedda Grading

Covid has limited the use of the action lab at the Klima2+ exhibition. How can this space become more active and be brought back into the exhibition? Since people can't do things physically at the museum right now, maybe they can get inspired to do something when they get home.

I have tried to create an area of inspiration, where the visitors can learn about composting. Through objects, illustrations and text people can learn how to compost their own foodwaste and how it benefits the climate.

The circular shape symbolize the cyclus of composting and the different heights of the tables represent how the foodwaste is broken down. The objects exhibited are related to the stages of the process.
